

Arduino FM Radio

James R. Di Re

Abdulrahman Kikia

Claudio Scione

Initial Objectives

- Must be portable —----->
- Should support different bands of reception (FM, AM, Shortwave, etc.)
- Display information on an LCD
- Support presets (ex. 1, 2, 3, 4, 5)
- RDS (prints current song)
- Scanning
- Bluetooth compatibility (i.e. play audio from your phone)

Inspiration

- James's idea. Wanted to do something involving audio (MIDI controller, synthesizer, etc.).
- Decided on radio after watching many YouTube videos and visiting Instructables links
- Intuitive - can pick up signal anywhere, for free.
- Practical - can listen to music, news, talk shows, traffic report, etc.

Put some images of inspiration videos

Design and Planning

- Initial radio sketches
- Problems
 - Speaker wires kept disconnecting
 - Speakers hard to mount on box (no screw holes)
- Adding features gradually (first rotary encoder, then LCD, then radio module, then amplifier and speaker)
- Cardboard prototype

Hardware Setup

List hardware

Put some of the in-progress images here

Put some diagram here for the circuit

<!-- Code -->

- Already had some prior knowledge of CPP from this tutorial series —----->
- Made writing the radio code simpler
- However, this was the first time putting that knowledge into practice

```
hd44780_I2Cexp lcd;
```

```
FrequencyType type = AM;
int frequency = 977;
// int amFrequency = 800;
int lastFrequency;

volatile int lastClkState = LOW;
volatile int count;
int lastCount;
```

```
void setup() {
    Serial.begin(9600);

    pinMode(PIN_CLK, INPUT);
    pinMode(PIN_DT, INPUT);

    attachInterrupt(digitalPinToInterrupt(PIN_CLK), pollRotaryEncoder, CHANGE);
}
```

```
int status = lcd.begin(16, 2);
if (status) {
    hd44780::fatalError(status);
}
```

```
void loop() {
    delay(100);

    UpdateCurrentFrequency();

    if (frequency != lastFrequency) {
        lastFrequency = frequency;

        PrintStationData();
    }
}
```

```
Serial.print("Count: ");
Serial.println(count);
}
```

```
void UpdateCurrentFrequency() {
    int currentCount = count;

    if (currentCount != lastCount) {
        int delta = currentCount - lastCount;

        if (type == FM) {
            frequency += delta * 2;
        }
    }
}
```

First code iteration:
Only LCD display
functionality

Later code iteration: separated into six files!
Reasons: Scalability, more control, more organized

`main.cpp` -

Entry point of the program. Contains `setup()` and `loop()` functions

`RadioHeaders.h` -

Header file for all the following classes. Contains variables and function declarations. All other files `#include` this

`class RadioHandler { }` -

General class for managing many of the properties of the radio. Manages current station, states, etc

`class RadioInput { }` -

Handles functionality for the rotary encoder and the joystick

`class RadioDisplay { }` -

Handles everything to do with displaying information on the LCD screen, including methods for printing text

`class RadioModule { }` -

Handles communicating with the radio module and tuning to stations.

The switch to Visual Studio Code

- Allowed for easy version control
- Underlines errors and points out flaws in the code
- Easy refactoring tools
- Easy way to see project structure
- Extension used:

```
void RadioHandler::Init() {
    if (EEPROM.read(INIT_ADDRESS) == 0xff) {
        EEPROM.update(INIT_ADDRESS, 10);

        for (int j = 1; j <= 2; j++) {
            int startAddress = (j == 1) ? FM_EEPROM_START : AM_EEPROM_START;
            int defaultStation = (j == 1) ? FM_LOWEST : AM_LOWEST;

            for (int i = 1; i <= 4; i++) {
                int address = startAddress + i * sizeof(unsigned short);
                unsigned short valueStored;
                EEPROM.get(address, valueStored);

                if (valueStored == 0xffff) StorePresetStation(i, defaultStation);
            }

            EEPROM.put(STANDBY_STATION_ADDRESS, (unsigned short)FM_LOWEST);
        }

        for (int i = 0; i < 4; i++) {
            savedPresets[i] = RetrievePresetStation(i + 1);
        }

        unsigned short standbyStation;
```

Counting objects: 100% (10/10), done.
Delta compression using up to 8 threads
Compressing objects: 100% (6/6), done.
Writing objects: 100% (6/6), 1.15 KiB | 1.15 MiB/s, done.
Total 6 (delta 3), reused 0 (delta 0), pack-reused 0
remote: Resolving deltas: 100% (3/3), completed with 3 local objects.

Libraries Used

- `hd44780` by Bill Perry. LCD library. Includes functions like `setCursor(0, 0)`, `print("")`, `clear()`
- `RotaryEncoder` by Matthias Hertel. Includes functions like `tick()` and `getDirection()`
- Also used code provided in the description of a YouTube video by Kevin Darrah, for tuning with the TEA5767 FM radio module

```
void setFrequency(float frequency)
{
    //Code from: http://playground.arduino.cc/Main/TEA5767Radio
    //Datasheet: https://www.sparkfun.com/datasheets/Wireless/General/TEA5767.pdf

    unsigned int frequencyB = 4 * (frequency * 1000000 + 225000) / 32768;
    // this is from the datasheet

    byte frequencyH = frequencyB >> 8; //shift over to get the high byte
    byte frequencyL = frequencyB & 0xFF; //cut off the top to get the LOW
    Wire.beginTransmission(0x60); //start talking to the radio
    Wire.write(frequencyH); //1st
    Wire.write(frequencyL); //2nd
    Wire.write(0xB0); //3rd
    Wire.write(0x12); //4th
    Wire.write(0x00); //5th
    Wire.endTransmission();
    delay(100);
}
```

Initial Design for the box

Had to be changed to make the
assembly possible

Persisting Issues:

- Interference noise caused by the LCD screen updating and joystick movement
- Joystick messing up the 1^2C communication lines. Causes code freeze ups. (Isolated problem by removing joystick code and changing station every 1 second)

Lacking Features:

- Only FM support. Plans to try out different (more low-level, complicated) radio module, but no time
- No Bluetooth connectivity
- No RDS, scanning, bluetooth support

Discussion and conclusion ?
